

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) An image display ~~device~~ device, comprising:
a display screen formed on the front of a cabinet and occupying the main part of the front;

an image forming device that, based on read image signals, forms an image corresponding to the image signals, on the display screen; and

a printer unit demountably accommodated in a recess formed in the cabinet.

2. (Currently Amended) The image display device according to Claim 1, further comprising:

~~guide~~ a guide means for guiding ~~to guide~~ the movement of the printer unit in the recess during the mounting and demounting of the printer unit; and

~~connector~~ a connector means that allows the exchange of signals between the image forming device and the printer unit, and that is disconnectable and connectable therebetween.

3. (Currently Amended) The image display device according to Claim 2, further ~~comprising~~ comprising:

~~locking~~ a locking means for bringing ~~device to bring~~ the printer unit into a locked state where the printer unit is fixed to the recess, in a state where the printer unit has been accommodated in the recess and the electrical connection between the image forming device and the printer unit has been established by the connector ~~means~~ device.

4. (Currently Amended) The image display device according to Claim 3, further ~~comprising~~ comprising:

_____ a lock element ~~for preventing~~ to prevent the locked state of the printer unit brought about by the locking ~~means~~ device from being released.

5. (Currently Amended) The image display device according to ~~any one of Claims 3 and 4~~ Claim 3, further ~~comprising~~ comprising:

_____ a release sensor ~~for detecting~~ to detect a release operation with respect to the locked state of the printer unit brought about by the locking ~~means~~ device.

6. (Currently Amended) An image display ~~device~~ device, comprising:
a display screen formed on the front of a cabinet and occupying the main part of the front;

an image forming device that, based on read image signals, forms an image corresponding to the image signals, on the display screen;

a printer unit demountably accommodated in a recess formed in the cabinet;

_____ a connector that allows the exchange of signals between the image forming device and the printer unit, and that is disconnectable and connectable therebetween.

~~locking~~ a locking means for bringing ~~device~~ to bring the printer unit into a locked state where the printer unit is fixed to the recess, in a state where the printer unit has been accommodated in the recess and the electrical connection between the image forming device and the printer unit has been established by the connector ~~means~~;

a release sensor ~~for detecting~~ to detect a release operation with respect to the locked state of the printer unit brought about by the locking ~~means~~ device; and

a controller ~~for causing~~ to cause the printer unit to perform forced print interruption processing if the printer unit is in course of performing print processing or

preparing for print processing, when the release of the locked state has been detected by the release sensor.

7. (Currently Amended) The image display device according to Claim 6, ~~wherein,~~ when the release of the locked state has been detected by the release sensor, if there is any print processing that is in course of being performed or prepared in the printer unit, the controller ~~interrupts~~ interrupting a power supply to the printer unit after the print interruption processing.

8. (Currently Amended) The image display device according to ~~any one of Claims 6 and 7~~ Claim 6, ~~wherein,~~ when the release of the locked state has been detected by the release sensor, the controller terminates the exchange of signals between the image forming device and the printer unit.

9. (Currently Amended) The image display device according to Claim 8, ~~wherein the controller comprises~~ including a first CPU provided in the image forming device and a second CPU provided in the printer unit, ~~wherein the controller causes~~ causing the printer unit to perform print processing by passing data signals between the first and second CPUs by communications based on a predetermined connection protocol, and ~~wherein,~~ before interrupting a power supply to the printer unit, the controller ~~terminates~~ terminating in advance the communications based on the predetermined connection protocol between the first, second, and first CPUs.

10. (Currently Amended) The image display device according to Claim 6, further ~~comprising~~ comprising:
 a locking sensor ~~for detecting~~ to detect that the printer unit is held in the locked state by the locking ~~means~~ device.

11. (Currently Amended) The image display device according to Claim 10, ~~wherein the locking sensor and the release sensor constitute~~ constituting a common

detachable switch provided in the locking ~~means~~device, ~~for detecting~~to detect the displacement of a movable member, and ~~wherein~~ the locking sensor and the release sensor ~~detect~~detecting the locked state and the release of the locked state based on a state of the detachable switch.

12. (Currently Amended) The image display device according to ~~any one of Claims 10 and 11~~Claim 10, ~~wherein~~, when the return to the locked state has been detected by the locking sensor, if printing is under forced interruption due to last demounting of the printer unit, the controller ~~causes~~causing the printer unit to restart the interrupted printing.
